

*The Human Factor - Working with Users*

---

# Learning and Problem Solving

---

Maria Wolters  
University of Edinburgh  
January 2015

---

# Relevant Learning Outcomes

---

- ❖ Understand:
  - ❖ What happens when a person learns something
  - ❖ What makes something memorable
- ❖ Remember:
  - ❖ Types of learning: paths to long-term memory
  - ❖ Learning lists: primacy versus recency
  - ❖ Mental Models
- ❖ Apply:
  - ❖ Determine what people need to learn in order to interact with / use a technology
  - ❖ Investigate steps people take to solve problems with user interfaces

---

# Problem Solving

---

In HCI context:

How can I get the system to do what I want it to do?

---

# The Path To Goal

---

- ❖ Can I start working towards the goal?
- ❖ What current state is the system in, and how far is this from my goal?
- ❖ What can I use (safely) to reach my goal?
  - ❖ How on earth does that work?
  - ❖ How many steps do I need?
  - ❖ Did that do anything?
- ❖ Have I reached my goal?

---

# The Complexities of Problem Solving

---

- ❖ User interface problems often interfere with real world problem solving (e.g., how to write a thesis)
- ❖ People can become fixated on a particular use of an object or a particular strategy
- ❖ How do people learn to use an interface?
  - ❖ Successful problem solving = learning

---

# What is Learning?

---

- ❖ Declarative learning: new items are stored in episodic and semantic (long-term) memory
- ❖ Procedural learning: new skills are acquired

---

# When Learning, You Need To

---

- ❖ Test yourself: Practice makes perfect
  - ❖ Practice does not mean repeat exposure
- ❖ Feedback: Check whether you got it right, or you will learn the wrong thing

---

# Learning Takes Time

---

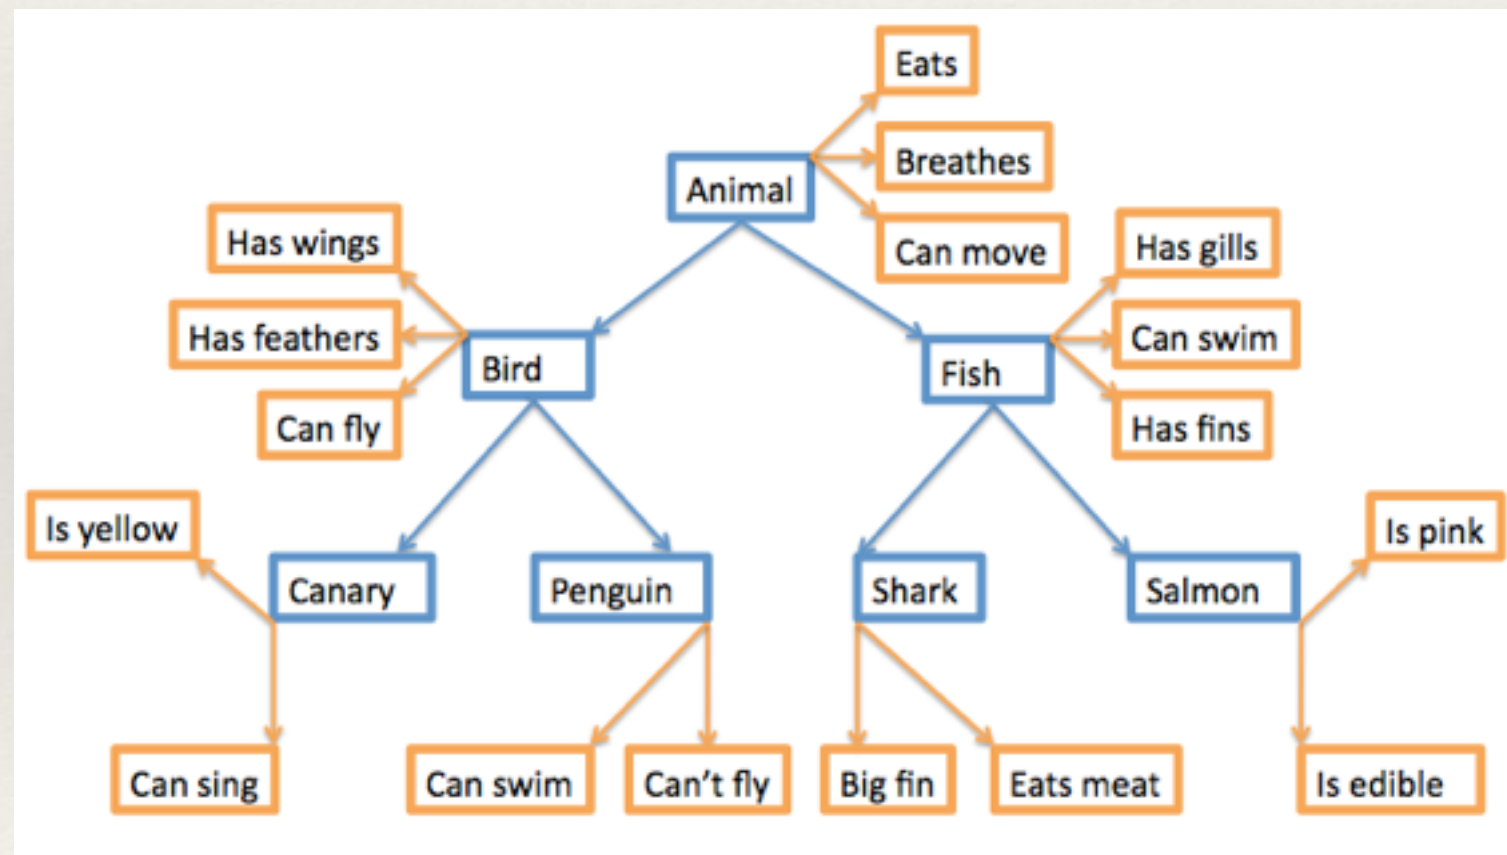

- ❖ Learning curve: amount retained versus time invested
- ❖ distributed practice (little and often) leads to faster learning
- ❖ knowledge generated oneself is learned better (“learning by doing / problem-based learning”)

# Learning Means Rich Representations

Knowledge is linked across long-term memory

Experts have richer, more stable representations

Source: [http://en.wikipedia.org/wiki/Mental\\_lexicon](http://en.wikipedia.org/wiki/Mental_lexicon)

---

# Implicit Learning

---

- ❖ Classical conditioning:  
if a stimulus (opening Microsoft Word) is mostly associated with a second stimulus (frustration when it crashes), the two become associated
- ❖ Priming:  
one stimulus primes a person to expect another stimulus (e.g. after opening an app on Mac, expect to see menu on top)
- ❖ Procedural learning:  
acquiring a new skill, e.g. typing

---

# Motivation For Learning?

---

Learning takes time and attention. People who are motivated are more likely to:

- spend enough time
- pay enough attention
- use the right learning strategies

---

# Advantages of Learning

---

- ❖ people become faster
- ❖ performance varies less
- ❖ people become better at the task
- ❖ less frustration, more flow
- ❖ people are ready to for shortcuts / new functionality that builds on what they have learned

---

# Mental Models

---

- ❖ Knowledge can be organised into mental models
  - ❖ Scripts: models for events, sequences of steps
  - ❖ Frames: models for objects and concepts with slots that can be instantiated
- ❖ In many cases, technology is part of the script

---

# Example 1: Script for Writing a Letter

---

- ❖ open new window in text processing software
- ❖ load appropriate letter template
- ❖ fill in fields
- ❖ print off
- ❖ put in envelope and stamp
- ❖ put in outgoing mail

---

# Example 2: Text Processor Frame

---

- ❖ Text processors (instance: Pages)
- ❖ run on a computer (Mac)
- ❖ and have templates for common text types (Pages Letter Template)
- ❖ that can be found in a menu (Pages: New Document Creation)
- ❖ and you can preview formatting (Pages: What You See Is What You Get)

---

# Mental Models in HCI

---

- ❖ What is the mental model of
  - ❖ the things people want to accomplish with the system?
  - ❖ how to accomplish these things?
  - ❖ the structure of the system?
- ❖ Whose mental model is it?
  - ❖ designer / analyst vs developer
  - ❖ people who use the system vs people who commission the system

---

# Change Blindness

---

Expectations are so strong that changes that do not conform to expectations are not detected.

(See the infamous Gorilla video)

use expectations to your advantage

---

# Learning Never Ends

---

- ❖ Learned knowledge, patterns, skills can be transferred to similar situations.
- ❖ A change of strategy / approach requires relearning
- ❖ This is why **consistency** is so important
